Problem

Board game players want more people to play with, especially people who enjoy the same genre. In their existing groups nobody knows which genres each member likes, so invitations go to the wrong people or miss the right ones. There is also no clear number showing how many players a session needs and how many are still missing, so organizers must ask one by one in chat. This wastes time and sessions often fail to come together.

Who has this problem?

Players already in a group who cannot find partners for the genre they like, because they do not know who likes what. Organizers who need a full table but do not know whom to invite for the right genre.

Why it matters / what it costs them

Lost time: posting in a chat, waiting for replies, counting by hand, and asking again when messages sink.

Lost chances to play: by the time the missing number is known it is almost game time; people who could join cannot decide in time, so the session fails even though interested people exist.

Wrong invitations: invited people are not interested, and interested people are never invited.

A barrier for newcomers: people without an existing circle cannot find open sessions because the information sits in closed groups.

Unreliable information: the "how many more" number in chat goes stale when people change their minds, so organizers recount again and again.

Gate 1 — Real users

1. Ms. Rawipriya Udomplaa (student) tel-0887741637 7 September 2569
2. Ms. Jeeranan Yepiang (student) tel-0946208353 7 September 2569
3. Mr. Apiwat Chaiswat(student) tel-0955687886 7 September 2569

Gate 2 — MVP scope

FR-1 Create a session A user creates a session with genre, date/time, location and the number of players needed Must

FR-2 Set favorite genres A user selects several genres they like or are good at; stored in the profile Must

FR-3 Join / leave a session A user joins a session; the system counts joined players and computes "how many more" in real time Must

FR-4 Filter sessions by genre A user filters the session list by the genres they are interested in Should

FR-5 Real-time session status The list updates instantly when someone joins or leaves, with no refresh Must

Which FRs contain real logic or decisions

FR-3: $\text{remaining_spots} = \text{max_players} - \text{current_joined}$; a join must be rejected when the session is full.

FR-5: state must be synchronized in real time across many users; if two users tap join at the same time with one spot left, only one may succeed.

FR-4 (stretch): if auto-match or room suggestions are built, matching a user's genre tags to a session's genre is additional logic. This is a Could item, not part of the core MVP.

Out of scope this term

Map / GPS view · waitlist when full · reminders and notifications · ratings and reviews · booking integration with cafes/shops · in-app chat.

Data that must persist

User profile: display name and favorite genre tags.

Session details: genre, location, date/time, maximum players, and current joined count.

Participation: who joined which session, used to compute free seats in real time and to reject joins when full.

Success metrics

ID	Metric	Target
SM-1	Time for an organizer to create a session	60 seconds or less
SM-2	Taps for a player to join an open session from the list 2 taps or fewer	2 taps or fewer
SM-3	Time for another device to show a join/leave change 2 seconds or less	2 seconds or less
SM-4	Filtered results that match the selected genre	100%

Gate 3 — Access and dependencies

Dependency	How we confirm it is really accessible
Auth provider (Google OAuth)	Create an OAuth client in Google Cloud Console before coding; check that it is free and what the rate limits are
Realtime database (Supabase)	Check that the free tier supports enough concurrent connections; set up a test project, send a realtime event, and confirm latency is about 2 seconds or better
Hosting (Vercel / Netlify)	Deploy from a free account and confirm no paywall blocks the realtime feature
