AI usage log

Tool / model	What we asked	What AI produced	What we changed / verified	What we learned
Claude	Check the revised Team Charter and SRS for the general activity-meetup version (7 FRs: map, in-room chat, auto-close, Google Calendar; genre features removed), and explain how the new app differs from the old one.	A review of the Charter and SRS (a Must FR depending on a Should FR, hosting named differently from the deployed site, "Pass" test results before the new version was built, a missing AI log section, smaller inconsistencies) and an old-vs-new comparison table. Google OAuth test-mode limits, the add-to-calendar link format and the OpenStreetMap tile policy were checked with live web searches, not from memory.	Later versions show the team promoted FR-4 and FR-7 to Must, aligned Charter FR-4 with the pinned-map wording, fixed the SM-2 typo, updated the SRS header to FR-1 to FR-7 / V2.0, and removed a duplicated heading.	Cross-checking documents against each other finds conflicts early, such as priority versus dependency. Limits of third-party services must be checked against current sources.
Claude	Re-check the Charter and SRS test versions after each round of edits.	A comparison of each version against the previous one, listing what was fixed and what was still open (an INVEST note saying the map could be postponed although it is now Must, "Pass" results, template leftovers such as "This example" and "(formerly FR-3)", Supabase/Vercel versus	list the items fixed after this review and the items deliberately left.	Re-checking after every edit round catches leftovers that a single review misses.

		Firebase, a shorter out-of-scope list in the Charter than in SRS section 6, missing edge-case criteria).		
Chatgpt	Asked AI for guidance, explanations, and suggestions to support the design of Sequence Diagrams, System Architecture, and the preparation of the NUDTEE project report.	Suggestions for system interactions, diagram structures, architecture components, technical explanations, and report organization.	Designed and organized the diagrams and report based on our understanding of the project. Reviewed the system components, corrected the message sequences, improved the technical descriptions, and checked that all information was consistent with the SRS and actual system requirements.	Learned how to design and explain system interactions, understand software architecture, prepare technical documentation, and verify project information accurately.
Chat gpt/Claude	"Help draft a Use Case Diagram structure in SVG/HTML format for a PDF report. Please use a blue-green color scheme matching the app's UI theme."	AI generated a high-resolution SVG canvas layout separating the Organizer on the left, Player on the right, and System Boundary in the center containing all core Use Cases.	Fine-tuned the SVG coordinates for relationship lines and <<include>> / External Service arrows to prevent overlap. Standardized all text labels and badges to map directly to the project's Functional Requirement codes (FR-1 to FR-7).	Human Validation: AI is great for discovering Edge Cases (like simultaneous joins or deadline expiry), but human developers must prune and align them with the exact FR scope.
Chat gpt/Claude	"แอป NUDTEE เป็นแอปนัดเล่นกีฬา มีฟีเจอร์สร้างห้อง แชทเรียลไทม์ และปักหมุดแผนที่ อยากใช้	AI proposed a NoSQL Document Store structure comprising:	Adopted the NoSQL architecture. Defined the exact schema for the embedded members array (storing uid, name, photo, bio, interests) so	NoSQL Schema Design: Embedding a members array in rooms (Denormalization) reduces document read counts,

	Google Cloud Firestore (Free Spark Plan) ช่วยออกแบบโครงสร้าง Collection ให้หน่อย ควรจัดเก็บข้อมูลยังไงไม่ให้เปลือง Read/Write Quota?”	1. users Collection (User profiles) 2. rooms Collection (Root collection for activity sessions) 3. messages Sub-collection (rooms/{roomId}/messages for real-time room chats) AI also suggested denormalizing joined user profiles directly inside the rooms document as an array of objects to minimize sub-collection reads.	the UI can render participant lists without performing additional database lookups.	staying strictly within Firebase free-tier Spark quotas.
Claude	Asked for help brainstorming ideas and planning the NUDTEE website	Claude suggested website features, page layouts, and ways to improve the user experience.	We selected and adjusted the ideas to match our project requirements.	We learned how to plan a website and organize its features.
	Asked Claude to help write the actual website code using HTML, CSS, and JavaScript.	Claude generated code for website pages, layouts, and functions.	We reviewed the code, made adjustments, and checked whether the website worked correctly.	We learned how to build a website and understand how HTML, CSS, and JavaScript work together.
ChatGPT (GPT-6)	Help us plan and improve the UI design of the NUDTEE website, including page layouts and interface elements.	Suggestions for page layouts, UI components, and user experience improvements.	We selected and adjusted the suggestions to match our project requirements and created the actual UI designs using Canva.	We learned how to organize website layouts and create a user-friendly interface.
